

**SMOKE PROJECTILE****ABSTRACT OF THE DISCLOSURE**

A fog projectile having a pyrotechnic active charge which emits in the infrared and is impenetrable in the visual through the formation of a large fog curtain which is protective of a target, is of a simple structure and results in a rapid fading of the line-of-sight in the infrared and in the visual radiation range upon discharge of the active charge and fanning out over a wide spatial angle. The active charge is formed by a hollow-cylindrical stack, which is composed of a plurality of superimposed layers of hollow-cylindrical segments 6 and is arranged in an enclosure constituted of a combustible foil material.
